1. What the project is

The website for Expert Mobile Communications Ltd. and its brands (Canadian Wireless Supply, Inrico Canada, Wirox). It presents solutions, brands (Hytera, Icom, BelFone, President), rentals and a dealer network of 15+ dealers in 3 countries, with a live push-to-talk console demo. A Python build step bundles everything into one self-contained index.html, and a built-in admin panel lets staff edit content and invite team members.

2. Why it was built

The company needed a fast, easy-to-host website that non-developers can update, without a heavy CMS or server to maintain.

3. How it works, step by step

Step	Stage	What happens
1	**Edit**	Content is changed in src/template.html or through the admin panel; images are swapped in the images folder.
2	**Build**	python src/build.py bundles HTML, CSS, JavaScript and images into dist/index.html.
3	**Publish**	The single file is uploaded to GitHub Pages, Netlify Drop or Firebase Hosting.
4	**Manage**	The admin panel handles content, team members and invite links.

4. Features

- Single self-contained HTML file
- Live push-to-talk console demo
- Brand and solutions showcase, rentals and dealer network
- Admin panel with content editing and team invites
- Ready for GitHub Pages, Netlify and Firebase

5. Architecture

Template + assets -> Python build script -> one HTML file -> any static host. The admin panel (cms.js / cms.css) runs inside the page.

6. Technologies used

Each technology and the job it does in this project:

Technology	What it is used for
HTML5 / CSS3	HTML structures each page; CSS handles layout, colour, typography and responsive design for phones and desktops.
JavaScript	The language of the browser; powers the interactive parts of the interface.
Python	General-purpose programming language used for data processing, automation scripts and back-end logic.
Netlify / Firebase Hosting	Alternative static hosts; the single-file build can be dropped onto either.
GitHub Pages	Free static hosting directly from a GitHub repository.
Git / GitHub	Version control and code hosting; every change is tracked and can be rolled back.

7. Security & privacy

- No server to patch; static hosting only.
- Admin access by invitation.

8. Results

- One file to upload anywhere.
- Company details kept current by staff.

9. Next steps

- Dealer locator map
