PROJECT README

Portfolio Website with Admin CMS

A fast, animated portfolio that I can edit entirely from the browser.

Type	Personal website
Year	2026
Role	Designer and developer
Repository	github.com/Masum-jubayel/masum_jubayel
Live site	masum-jubayel.vercel.app

Home page in the Dark theme.

Contents

1. What the project is 2. Why it was built 3. How it works 4. Features 5. Architecture 6. Technologies 7. Security & privacy 8. Results 9. Next steps

1. What the project is

My personal portfolio: profile, resume, projects, blog, gallery and memories, with a built-in admin console. Every section can be edited from the browser, photos and videos can be adjusted without changing the originals, and visitors can switch between Dark, Light and Jarvis themes.

2. Why it was built

I wanted one place for my work that I can keep current myself, that loads fast, costs nothing to host and never goes to sleep.

3. How it works, step by step

Step	Stage	What happens
1	**Visit**	Pages are rendered by Next.js and served from Vercel's global network.
2	**Read content**	Content comes from built-in defaults merged with anything saved in Supabase.
3	**Sign in**	Admins sign in with a magic link; the database checks the is_admin flag.
4	**Edit**	The admin console saves sections, posts, gallery items and memories to Supabase, protected by row-level security.
5	**Adjust media**	The media editor stores focus, zoom, colour and trim settings with the file link.
6	**Stay awake**	A daily Vercel cron job calls a protected keep-alive endpoint so the free database never pauses.

4. Features

- Admin console for every section
- Blog with categories, tags and attachments
- Project library with filters and 12-per-page pagination
- Gallery with animated point-cloud hero, film strip and memories feed
- Non-destructive photo and video editor
- Dark, Light and Jarvis themes
- Hidden admin entry
- Daily keep-alive and contact email

5. Architecture

Next.js (App Router) on Vercel. Supabase provides PostgreSQL, authentication and storage. Resend sends email. Configuration and secrets live in Vercel environment variables, never in Git.

6. Technologies used

Each technology and the job it does in this project:

Technology	What it is used for
Next.js 15	React framework providing routing, server rendering and API routes; pages load fast and are search-engine friendly.
React 19	Library for building user interfaces from reusable components.
TypeScript	JavaScript with static types; catches mistakes before the code runs and makes larger code bases easier to maintain.
Tailwind CSS	Utility-first CSS framework; colours are wired to CSS variables so themes can change instantly.
Motion	Animation library for smooth, interruptible animations that respect reduced-motion settings.
Supabase (PostgreSQL, Auth, RLS)	Hosted PostgreSQL database with sign-in and file storage. Row-level security (RLS) enforces who may read or write each row.
Vercel (hosting, cron)	Hosting platform that builds the site from GitHub on every push and runs scheduled jobs.
Resend	Email-sending service used for contact-form messages.
Git / GitHub	Version control and code hosting; every change is tracked and can be rolled back.

7. Security & privacy

- Writes are allowed only for admin accounts, enforced by the database.
- The service key never reaches the browser.
- Secrets are excluded from Git and GitHub push protection is respected.

8. Results

- Live on free tiers.
- Content updates take seconds.

9. Next steps

- Live links for every project
- Analytics dashboard
